

ConfigurationEventResponse.doxydoc

```
class ConfigurationEventResponse
```

- Contains the response for an ConfigurationEventResponse.

```
const VerifoneSdk::StatusInformation StatusInformation
```

```
ation StatusInformation.
```

```
System::String *DeviceId
```

```
DeviceId when a request came from the terminal from ConfigurationRequestEvent.
```

```
System::String *Message
```

- The message in case of a failure.
- Primarily used for logging, though it can be displayed to the cashier to allow them to better respond to the specific error scenario. See `setMessage()` to set this value when responding to an input event request and there is some error, otherwise leave it empty.

```
Int32 Status
```

- The status to mark it as failed for some specific reason.
- Common failed statuses include `StatusCode::CANCELLED`, `StatusCode::COMMAND_TIMED_OUT`, and `StatusCode::UNSUPPORTED_COMMAND`. See `getStatus()`. Set this status when responding to an input event request if the user cancels or if there is some error.

```
CommerceResponse *AsCommerceResponse(VerifoneSdk::ConfigurationEventResponse
```

```
*configurationEventResponse)
```

- Generate CommerceResponse from the provided response.
