<b>Data Structures</b>	
struct	<a href="#">Placeholder</a>
<b>Public Member Functions</b>	
	<a href="#">SdiCrypt ()</a>
	<a href="#">~SdiCrypt ()</a>
bool	<a href="#">open</a> (const char *hostName) call SDI Crypto Open (70-00). <a href="#">More...</a>
bool	<a href="#">close</a> () call SDI Crypto Open Close (70-01). <a href="#">More...</a>
bool	<a href="#">isOpen</a> () const Check if a crypto handle is present. <a href="#">More...</a>
uint32_t	<a href="#">getCryptoHandle</a> ()

	Read the crypto handle obtained by SDI Crypto Open. <a href="#">More...</a>
bool	<a href="#">encrypt</a> (const std::vector< unsigned char > &data, std::vector< unsigned char > &encrypted)
	SDI Crypto Encrypt (70-02). <a href="#">More...</a>
bool	<a href="#">decrypt</a> (const std::vector< unsigned char > &encrypted, std::vector< unsigned char > &decrypted)
	SDI Crypto Decrypt (70-03). <a href="#">More...</a>
bool	<a href="#">sign</a> (const std::vector< unsigned char > &data, std::vector< unsigned char > &signature)
	SDI Crypto Sign (70-04). <a href="#">More...</a>
bool	<a href="#">verify</a> (const std::vector< unsigned char > &data, const std::vector< unsigned char > &signature)
	SDI Crypto Verify (70-05). <a href="#">More...</a>
bool	<a href="#">updateKey</a> (unsigned char keyType, const std::vector< unsigned char > &keyData, std::vector< unsigned char > *proprietaryData=NULL, const unsigned char AS2805=0, std::vector< unsigned char > *KCV=NULL)
	SDI Crypto Update Key (70-06). <a href="#">More...</a>
bool	<a href="#">setKeySetId</a> (uint32_t ksid, uint32_t mksid=0, bool asAttribute=false)
	Set Key Set (70-07) or setter for <a href="#">getEncData()</a> , <a href="#">getEncMsgData()</a> and <a href="#">getMsgSignature()</a> depending on parameter <code>asAttribute</code> . <a href="#">More...</a>
bool	<a href="#">getEncryptedPin</a> (unsigned char pinBlockFormat, std::vector< unsigned char > &pinBlock, bool requestZeroPinBlock=false)
	Get encrypted PIN (70-08). <a href="#">More...</a>
std::string	<a href="#">getKeyInventory</a> ()
	Get Key Inventory (70-09). <a href="#">More...</a>
bool	<a href="#">getKeyData</a> (unsigned char keyType, std::vector< unsigned char > &keyData, unsigned char kekFlag=0)
	Get Key Data (70-0A). <a href="#">More...</a>

std::string	<a href="#">getStatus</a> ()
	Get Status of security module (70-0B) with handle received by <a href="#">open()</a> . <a href="#">More...</a>
std::string	<a href="#">getStatus</a> (std::string hostName)
	Get Status of security module (70-0B) for given host name or for all security modules. <a href="#">More...</a>
void	<a href="#">setInitialVector</a> (const std::vector< unsigned char > &iv)
	Set Initial Vector for various cipher commands (DFA403) <a href="#">More...</a>
void	<a href="#">getInitialVector</a> (std::vector< unsigned char > &iv) const
	Get Initial Vector returned by various cipher commands. <a href="#">More...</a>
void	<a href="#">getKeySerialNumber</a> (std::vector< unsigned char > &ksn) const
	Get key serial number returned by various cipher commands. <a href="#">More...</a>
bool	<a href="#">getEncData</a> (const <a href="#">Placeholder</a> &descriptor, std::vector< unsigned char > &encrypted, bool useStoredData=false, bool incrementKSN=false)
	Encryption command for card holder sensitive data (29-00). <a href="#">More...</a>
bool	<a href="#">getEncMsgData</a> (const std::vector< unsigned char > &messageTemplate, const std::vector< <a href="#">Placeholder</a> > &placeholder, std::vector< unsigned char > &encrypted, bool useStoredData=false, bool incrementKSN=false)
	Encryption command for card holder sensitive data in host messages (29-01) <a href="#">More...</a>
bool	<a href="#">getMsgSignature</a> (const std::vector< unsigned char > &messageTemplate, const std::vector< <a href="#">Placeholder</a> > &placeholder, std::vector< unsigned char > &signature, bool useStoredData=false, bool incrementKSN=false)
	Singing of host messages (29-04). <a href="#">More...</a>
bool	<a href="#">getEncTrxDData</a> (const std::vector< unsigned long > tags, std::vector< unsigned char > &data)
	Perform the command to get encrypted transaction data for later use (29-07). <a href="#">More...</a>

bool	<a href="#">setEncTrxData</a> (const std::vector< unsigned char > data)
	Perform the command to send encrypted transaction data back to the SDI Server (29-08). <a href="#">More...</a>
bool	<a href="#">endEncTrxData</a> ()
	Perform the command to finish the encrypted transaction data procedure inside the SDI Server (29-09). <a href="#">More...</a>
▶ Public Member Functions inherited from <a href="#">SdiBase</a>	
	<a href="#">SdiBase</a> ()
enum <a href="#">SDI_SW12</a>	<a href="#">getSdiSw12</a> ()
int	<a href="#">getAdditionalResultValue</a> ()
	Access Additional Result Value if returned in SDI response. <a href="#">More...</a>
<a href="#">SDICLIENT_ERROR</a>	<a href="#">getClientError</a> ()
	Access client side error codes. <a href="#">More...</a>
enum <a href="#">SDI_SW12</a>	<a href="#">receiveSW12</a> ()
	Receive SDI server response with no data. <a href="#">More...</a>
void	<a href="#">clear</a> ()
	clear result data obtained from SDI communication <a href="#">More...</a>
void	<a href="#">importResults</a> (const <a href="#">SdiBase</a> &intermediate)
	set result data obtained from intermediate SDI communication <a href="#">More...</a>
<b>Static Public Member Functions</b>	
static std::string	<a href="#">getVersions</a> (int &additionalResult)
	Get versions of SEC ADK components (70-0C). <a href="#">More...</a>
<b>Additional Inherited Members</b>

<a href="#">SDIClient_ERROR</a>	<a href="#">clientErr</a>

## Detailed Description

[SdiCrypt](#) holding the crypto handle from Crypto Open. General notes for most functions in this class:

- In case of error the SDI server's SW1 SW2 can be read with [getSdiSw12\(\)](#)
- If present, additional error info can be read with [getAdditionalResultValue\(\)](#)
- If a Initial Vector is required or received (random mode) it is managed by [getInitialVector\(\)](#) and [setInitialVector\(\)](#).
- If an KSN has been returned by the SDI server it can be read with [getKeySerialNumber\(\)](#)

## Data Structure Documentation

### ◆ [libsdiprotocol::SdiCrypt::Placeholder](#)

```
struct libsdiprotocol::SdiCrypt::Placeholder
```

Data descriptor for [getEncData\(\)](#), [getEncMsgData\(\)](#) and [getMsgSignature\(\)](#)

Data Fields		
vector< unsigned char >	applicationData	data that can be referenced in <a href="#">Placeholder::tagList</a> (DFA120)
vector< unsigned char >	dataOptions	data formatting options (DFA121) - see SDI programmers guide, <a href="#">getEncData</a> (29-00)
vector< unsigned char >	tagList	DOL format with length 0 for variable lengths (DF8F30)

## Constructor & Destructor Documentation

### ◆ SdiCrypt()

SdiCrypt	(		)	
----------	---	--	---	--

### ◆ ~SdiCrypt()

~SdiCrypt	(		)	
-----------	---	--	---	--

## Member Function Documentation

### ◆ close()

bool close	(		)	
------------	---	--	---	--

call SDI Crypto Open Close (70-01).

This funtion is called by [SdiCrypt's](#) destructor and [open\(\)](#)

Returns

true in case of success

### ◆ decrypt()

bool decrypt	(	const std::vector< unsigned char > &	<i>encrypted</i> ,
		std::vector< unsigned char > &	<i>decrypted</i>
	)		

SDI Crypto Decrypt (70-03).

Parameters

[in]	encrypted	encrypted data
[out]	decrypted	buffer for decrypted data

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

Returns

true in case of success

◆ **encrypt()**

bool encrypt	(	const std::vector< unsigned char > &	<i>data,</i>
		std::vector< unsigned char > &	<i>encrypted</i>
	)		

SDI Crypto Encrypt (70-02).

Parameters

[in]	data	data for encryption
[out]	encrypted	buffer for encrypted data

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

Returns

true in case of success

◆ **endEncTrxData()**

bool endEncTrxData	(		)	
--------------------	---	--	---	--

Perform the command to finish the encrypted transaction data procedure inside the SDI Server (29-09).

Returns

true in case of success

◆ **getCryptoHandle()**

uint32_t getCryptoHandle	(		)	
--------------------------	---	--	---	--

Read the crypto handle obtained by SDI Crypto Open.

Intended for commands that are not handled by this object.

Returns

crypto handle, -1 when [open\(\)](#) was not called or failed

### ◆ [getEncData\(\)](#)

bool getEncData	(	const <a href="#">Placeholder</a> &	<i>descriptor,</i>
		std::vector< unsigned char > &	<i>encrypted,</i>
		bool	<i>useStoredData = false,</i>
		bool	<i>incrementKSN = false</i>
	)		

Encryption command for card holder sensitive data (29-00).

Parameters

[in]	descriptor	Description of data to be encrypted
[out]	encrypted	Encrypted data
[in]	useStoredData	flag for using stored transaction data
[in]	incrementKSN	activate call to <a href="#">secIncrementKSN()</a>

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

[setKeySetId\(\)](#) (DFA409, DFA415)

Returns

true for success

### ◆ [getEncMsgData\(\)](#)

bool getEncMsgData	(	const std::vector< unsigned char > &	<i>messageTemplate,</i>
		const std::vector< <a href="#">Placeholder</a> > &	<i>placeholder,</i>
		std::vector< unsigned char > &	<i>encrypted,</i>

		bool	<code>useStoredData = false,</code>
		bool	<code>incrementKSN = false</code>
	)		

Encryption command for card holder sensitive data in host messages (29-01)

Parameters

[in]	messageTemplate	Message Template including place holders for sensitive data elements
[in]	placeholder	Descriptions of data to be encrypted
[out]	encrypted	Encrypted data
[in]	useStoredData	flag for using stored transaction data
[in]	incrementKSN	activate call to <a href="#">seclIncrementKSN()</a>

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

[setKeySetId\(\)](#) (DFA409, DFA415)

Returns

true for success

◆ **getEncryptedPin()**

bool getEncryptedPin	(	unsigned char	<code>pinBlockFormat,</code>
		<code>std::vector&lt; unsigned char &gt; &amp;</code>	<code>pinBlock,</code>
		bool	<code>requestZeroPinBlock = false</code>
	)		

Get encrypted PIN (70-08).

Parameters

[in]	pinBlockFormat	PIN block format, 0:ISO0, 1:ISO1, 2:ISO2, 3:ISO3
------	----------------	--

[out]	pinBlock	encrypted PIN
[in]	requestZeroPinBlock	true for zero PIN block

Returns  
true in case of success

### ◆ getEncTrxDATA()

bool getEncTrxDATA	(	const std::vector< unsigned long >	tags,
		std::vector< unsigned char > &	data
	)		

Perform the command to get encrypted transaction data for later use (29-07).

Parameters

[in]	tags	tag list including all requested data elements
[out]	data	encrypted block containing the requested tags with the transaction data

Returns  
true in case of success

### ◆ getInitialVector()

void getInitialVector	(	std::vector< unsigned char > &	iv	)	const	inline
-----------------------	---	--------------------------------	----	---	-------	--------

Get Initial Vector returned by various cipher commands.

Parameters

[out]	iv	Initial Vector
-------	----	----------------

### ◆ **getKeyData()**

bool getKeyData	(	unsigned char	<i>keyType</i> ,
		std::vector< unsigned char > &	<i>keyData</i> ,
		unsigned char	<i>kekFlag</i> = 0
	)		

Get Key Data (70-0A).

Parameters

[in]	keyType	Key Type
[out]	keyData	information about key data
[in]	kekFlag	Bendigo KEK Flag 1: KEK1, 2: KEK2

Returns

true in case of success

### ◆ **getKeyInventory()**

std::string getKeyInventory	(		)	
--------------------------------	---	--	---	--

Get Key Inventory (70-09).

Returns

json string with information about keys of the opened security module.

### ◆ **getKeySerialNumber()**

void getKeySerialNumber	(	std::vector< unsigned char > &	<i>ksn</i>	)	const	inline
----------------------------	---	--------------------------------	------------	---	-------	--------

Get key serial number returned by various cipher commands.

Parameters

[out]	ksn	Key Serial Number
-------	-----	-------------------

### ◆ [getMsgSignature\(\)](#)

bool getMsgSignature	(	const std::vector< unsigned char > &	<i>messageTemplate,</i>
		const std::vector< <a href="#">Placeholder</a> > &	<i>placeholder,</i>
		std::vector< unsigned char > &	<i>signature,</i>
		bool	<i>useStoredData = false,</i>
		bool	<i>incrementKSN = false</i>
	)		

Singing of host messages (29-04).

Parameters

[in]	messageTemplate	Message Template including place holders for sensitive data elements
[in]	placeholder	Descriptions of data to be encrypted
[out]	signature	Signature
[in]	useStoredData	flag for using stored transaction data
[in]	incrementKSN	activate call to <a href="#">secIncrementKSN()</a>

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

[setKeySetId\(\)](#) (DFA409, DFA415)

Returns

true for success

### ◆ [getStatus\(\)](#) [1/2]

```
std::string getStatus ( )
```

Get Status of security module (70-0B) with handle received by [open\(\)](#).

Returns  
status information as JSON string

◆ **getStatus() [2/2]**

```
std::string getStatus ( std::string hostName )
```

Get Status of security module (70-0B) for given host name or for all security modules.

Parameters

[in]	hostName	configuration name. Use empty string to address all modules.
------	----------	--

Returns  
status information as JSON string

◆ **getVersions()**

```
static std::string getVersions ( int & additionalResult ) static
```

Get versions of SEC ADK components (70-0C).

Parameters

[out]	additionalResult	SDI Additional Result Value in case of error
-------	------------------	--

Returns  
version information

◆ **isOpen()**

bool isOpen	(		)	const
-------------	---	--	---	-------

Check if a crypto handle is present.

Returns

false if crypto handle has not been obtain or if close has been called

### ◆ **open()**

bool open	(	const char *	<i>hostName</i>	)	
-----------	---	--------------	-----------------	---	--

call SDI Crypto Open (70-00).

The crypto handle received from SDI server is stored and used inside this object.

Parameters

[in]	hostName	host name
------	----------	-----------

Returns

true in case of success

### ◆ **setEncTrxDATA()**

bool setEncTrxDATA	(	const std::vector< unsigned char >	<i>data</i>	)	
--------------------	---	---------------------------------------	-------------	---	--

Perform the command to send encrypted transaction data back to the SDI Server (29-08).

Parameters

[in]	data	encrypted block containing the transaction data to be sent to the SDI Server
------	------	--

Returns

true in case of success

### ◆ **setInitialVector()**

void setInitial Vector	(	const std::vec tor< unsigne d char > &	iv	)		inline
------------------------------	---	---	----	---	--	--------

Set Initial Vector for various cipher commands (DFA403)

Setter for [encrypt\(\)](#), [decrypt\(\)](#), [sign\(\)](#), [verify\(\)](#), [getEncData\(\)](#), [getEncMsgData\(\)](#) and [getMsgSignature\(\)](#)

Sent once only, that is any call to methods listed above will clear the initial vector.

Parameters

[in]	iv	Initial Vector
------	----	----------------

### ◆ setKeySetId()

bool setKeySetId	(	uint32_t	ksid,
		uint32_t	mksid = 0,
		bool	asAttribute = false
	)		

Set Key Set (70-07) or setter for [getEncData\(\)](#), [getEncMsgData\(\)](#) and [getMsgSignature\(\)](#) depending on parameter `asAttribute`.

Parameters

[in]	ksid	Key Set Id (DF409)
[in]	mksid	Master Key Set Id (DFA415)
[in]	asAttribute	key set ids are stored in this object and sent with each <a href="#">getEncData()</a> , <a href="#">getEncMsgData()</a> and <a href="#">getMsgSignature()</a> . Behavior to be reset by providing zero values.

Returns  
true in case of success

### ◆ sign()

bool sign	(	const std::vector< unsigned char > &	<i>data</i> ,
		std::vector< unsigned char > &	<i>signature</i>
	)		

SDI Crypto Sign (70-04).

Parameters

[in]	data	data to sign
[out]	signature	MAC or signature

Setters

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

Returns

true in case of success

### ◆ updateKey()

bool updateKey	(	unsigned char	<i>keyType</i> ,
		const std::vector< unsigned char > &	<i>keyData</i> ,
		std::vector< unsigned char > *	<i>proprietaryData</i> = NULL,
		const unsigned char	<i>AS2805</i> = 0,
		std::vector< unsigned char > *	<i>KCV</i> = NULL
	)		

SDI Crypto Update Key (70-06).

Parameters

[in]	keyType	SEC ADK key type
[in]	keyData	Key Data or DUKPT Initial Key or 'KSN incrementation'
[in]	proprietaryData	Proprietary Data (e.g. KSN)
[in]	AS2805	AS2805 Tag, possible valid values: 1 ... 255
[in,out]	KCV	Key Check Value

**Setters**

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

**Returns**

true in case of success

**◆ verify()**

bool verify	(	const std::vector< unsigned char > &	<i>data</i> ,
		const std::vector< unsigned char > &	<i>signature</i>
	)		

SDI Crypto Verify (70-05).

**Parameters**

[in]	data	signed data
[in]	signature	MAC or signature

**Setters**

[setInitialVector\(\)](#) (DFA403) **Note** Will be sent only once

**Returns**

true in case of successful positive verification
