

User Defined Catalog Configurations

SCA Application is updated to provide a user defined catalog for GUI and Printer for the Merchant. Merchant can override the messages in catalog by configuring these messages in the given configuration files. By default, the application will provide the messages and titles along with HTMLs in the solution. If the above configuration files are provided then priority will be given to the entries in the configuration file over the default messages.

These files are provided for all three languages. If the format is not correct as defined by the solution, then application will reject the file. Configuration file contains key value pairs which can be updated into the catalog files. Following are the configuration file names:

- For UI: UIUpdateCtlg.INI
- For Print: PRTUpdateCtlg.INI

Catalog Entries in Transaction Flow

Fields	Description	Default Value
WelcomeMessage	Displays message on idle screen.	Welcome
tap1swipe1insert1	Displays message on card read screen.	Insert, Tap or Swipe
LINE_ITEM_DISPLAY	Title for line item screen.	Line Items

```

Triggering VHQ Downloads through Application

1. User can navigate to Configuration Menu and select Call TMS button that will contact VHR server for downloads.
2. Once it is downloaded, it will get installed on the device too.
