

## Checkout

### Overview

Checkout is an end-to-end solution that supports accepting payments securely hosted by Verifone. You can configure Checkout to accept card payments, as well as alternative payment methods through the same page. PCI-compliant card payments can be accepted through the checkout as a Hosted Payments Page (HPP), or as an iFrame.

Read [Accepting payments](#) to start your integration.

### Demo

The demo interface shows a Verifone checkout page. At the top left is the Verifone logo, and at the top right is the total amount €119.99. Below the logo, there is a section with the following details:

- Reference**: ORDER-1234
- Descriptor**: SNEAKERS DELUXE CO.
- Customer**: John

Below this section is a credit card payment form. It includes a credit card icon and the text "Credit card". The form has three input fields: "Card number" (with a placeholder "Your card number"), "Expiry" (with a placeholder "MM/YY"), and "CVV" (with a placeholder "CVV"). Below these fields is a blue button labeled "Pay €119.99". Under the button, it says "Secure payments provided by Verifone". At the bottom right of the form, there is a language dropdown menu set to "English".
