Onboarding the Device

Onboarding the device is enrolling the device details on Device Management.

The devices can be boarded using the following modes:

1. **Auto-boarding** - the device registers to **Verifone Central - Device Management** and gets auto-configured when the device for the first time establishes a connection with the server.

2. **Adding Devices Manually** - this feature provides an option to enter the device details manually through **Verifone Central - Device Management**.

3. **File Import** - this feature provides an option to onboard a large set of devices using batch upload.

- Uploading a CSV file
- Uploading an XML file

4. **Rest() API** - this feature provides an option to use APIs to onboard a large set of devices.

5. **Asset Tracking** - this feature provides an option to onboard a single or a large set of devices at the time of shipping the devices to the deployment center.
