

Getting started

Connecting to your device through the OakOS API

For this section you will need to [download and install Postman](#) onto your local machine.

Once you have Postman installed locally you can import our API into Postman. Click the top right button of [OakOS API documentation](#) that says "Run in Postman". This will import our API into your Postman App.

Now you have a copy of our API and will need to now setup environmental variables in order to hook everything up.

NOTE: In order to use the API you will need to first send your dashboard username and password to the the API. Postman will store a session cookie for that authentication to be used an all other calls in the Dashboard.
